

Exercise 1 GPARTED

We need to create a new hard disk for our virtual machine of 10gb. Then, we change the Windows' ISO file for the Debian's ISO file; now, we put a new hard disk following this few steps:

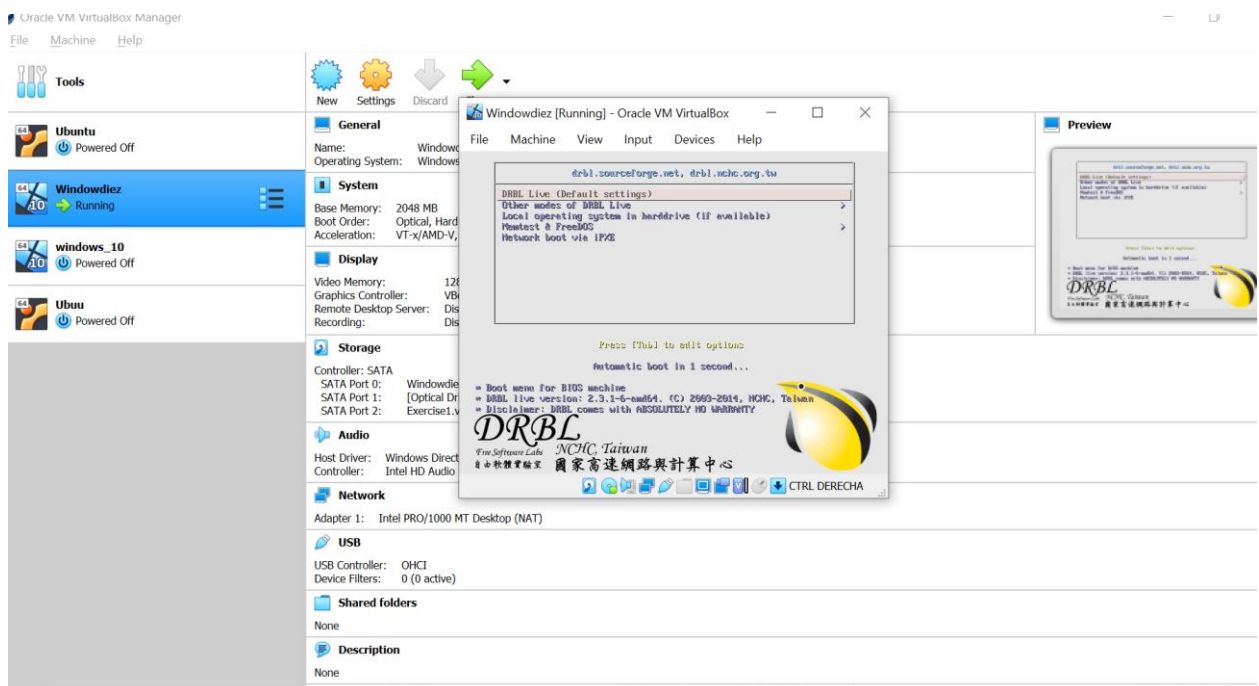

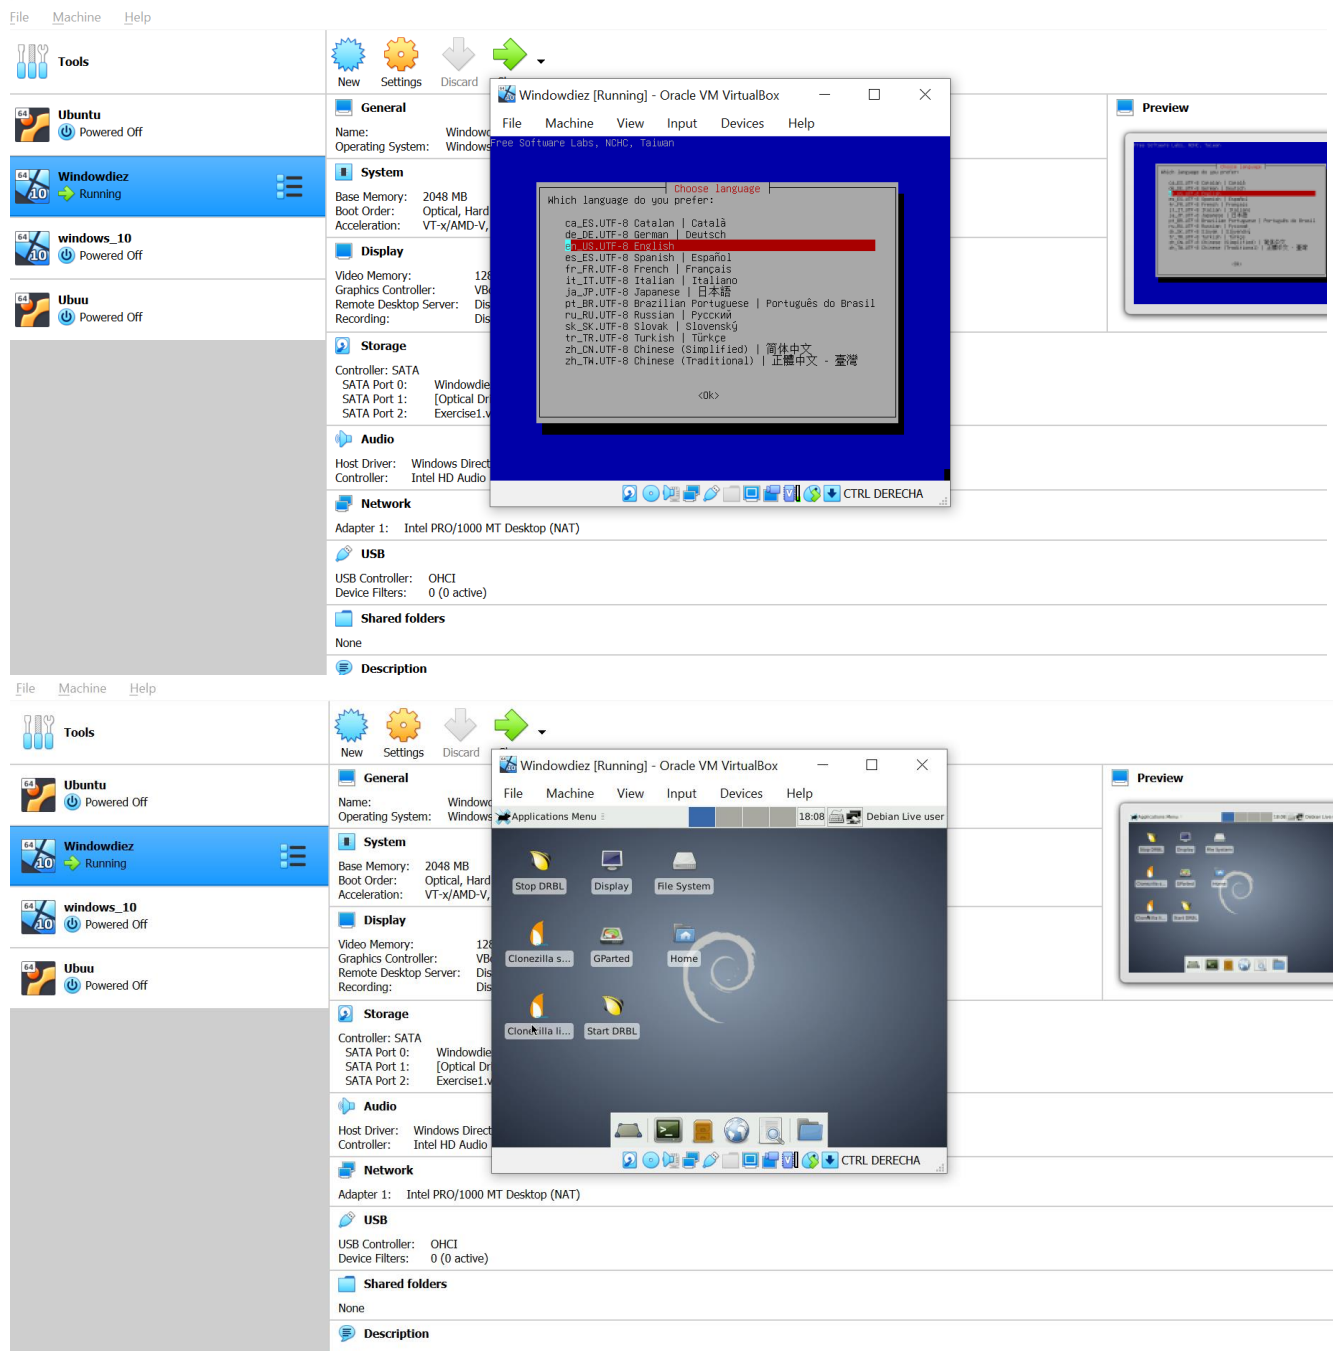

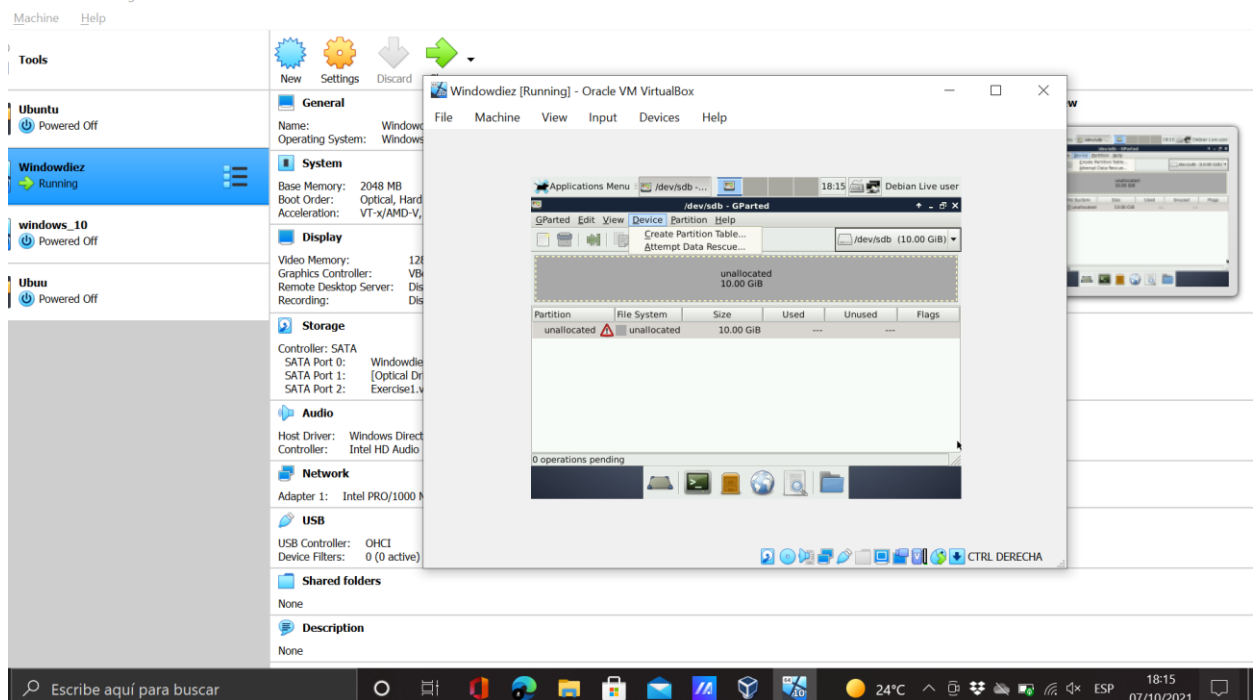

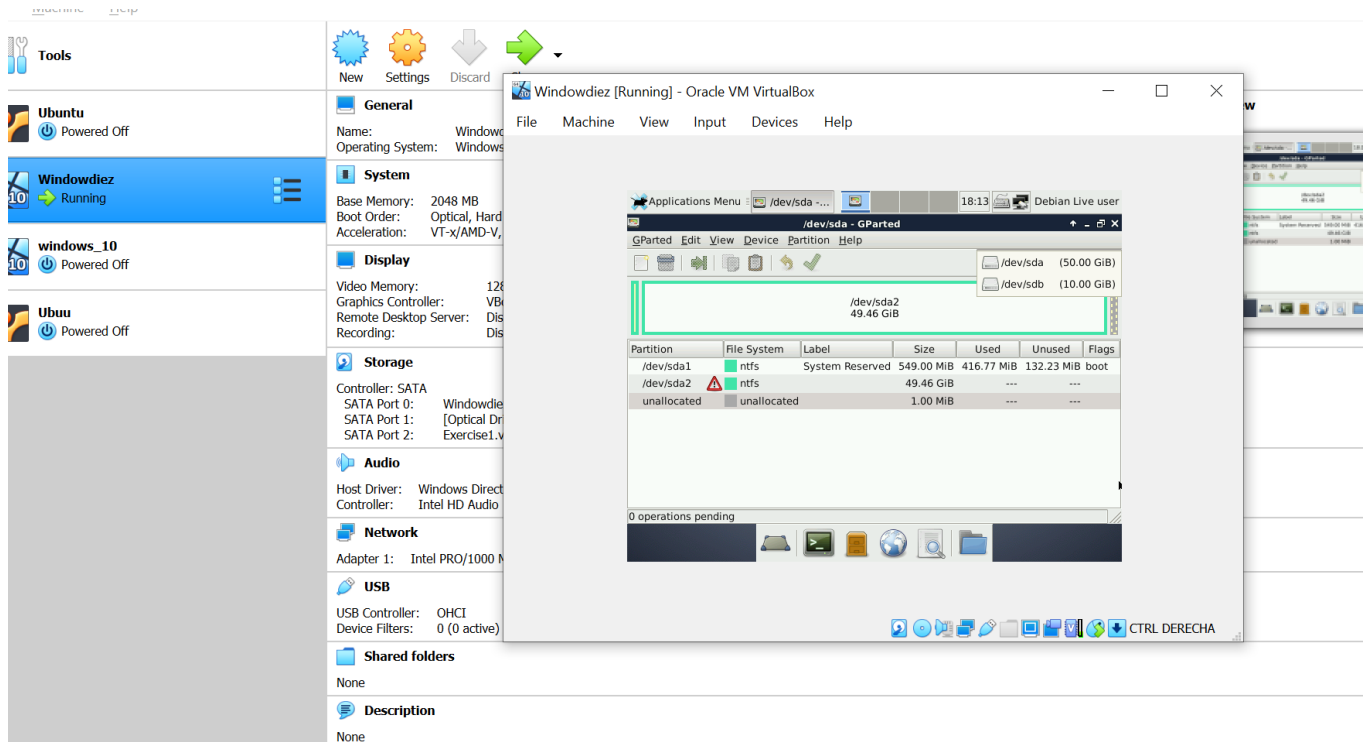

Now we start our virtual machine and go on with the defaults items by Debian OS:

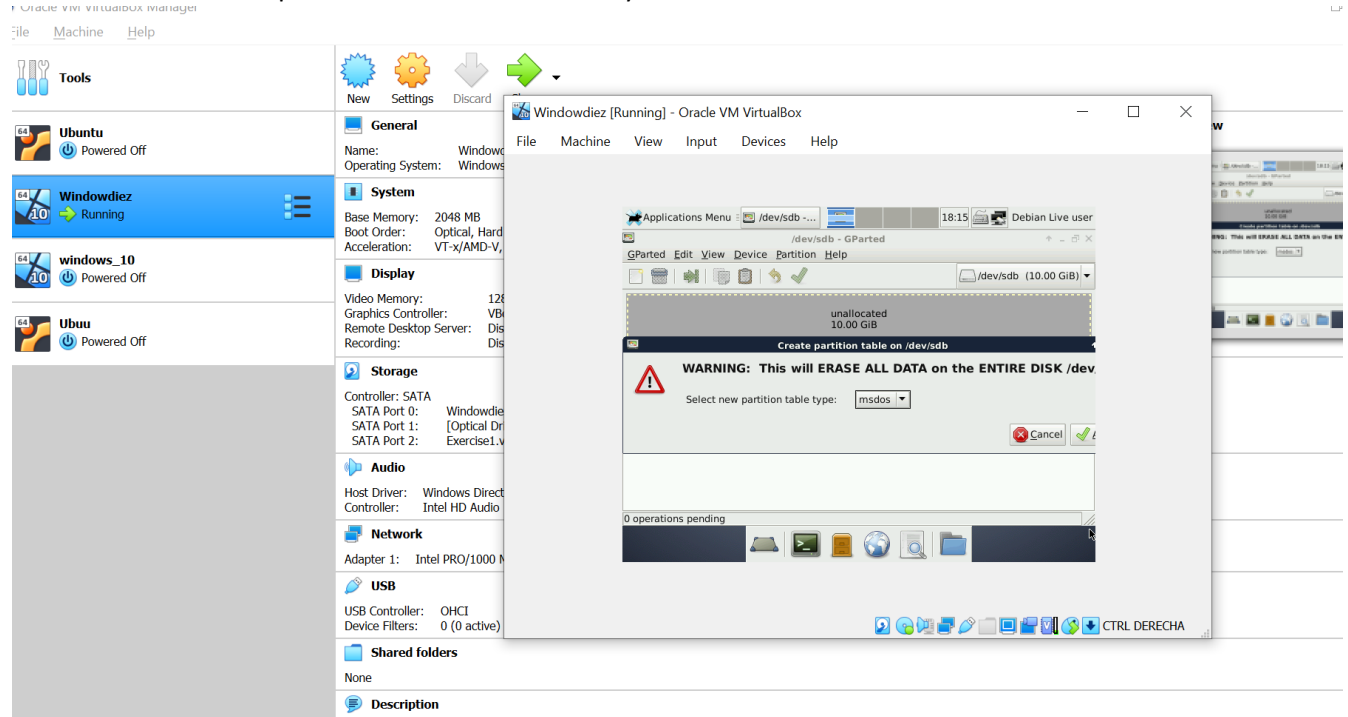

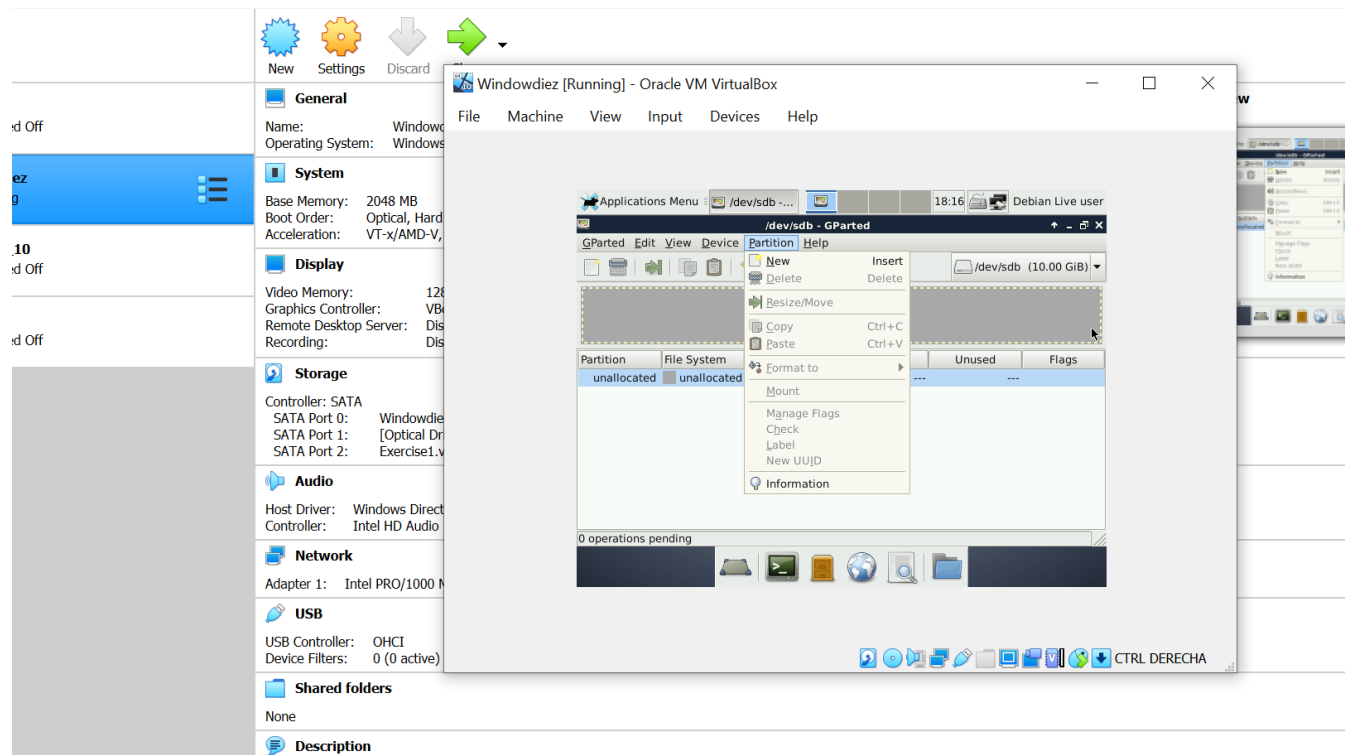

We select Gparted on the desktop to start the partition. We select the 10gb disk:

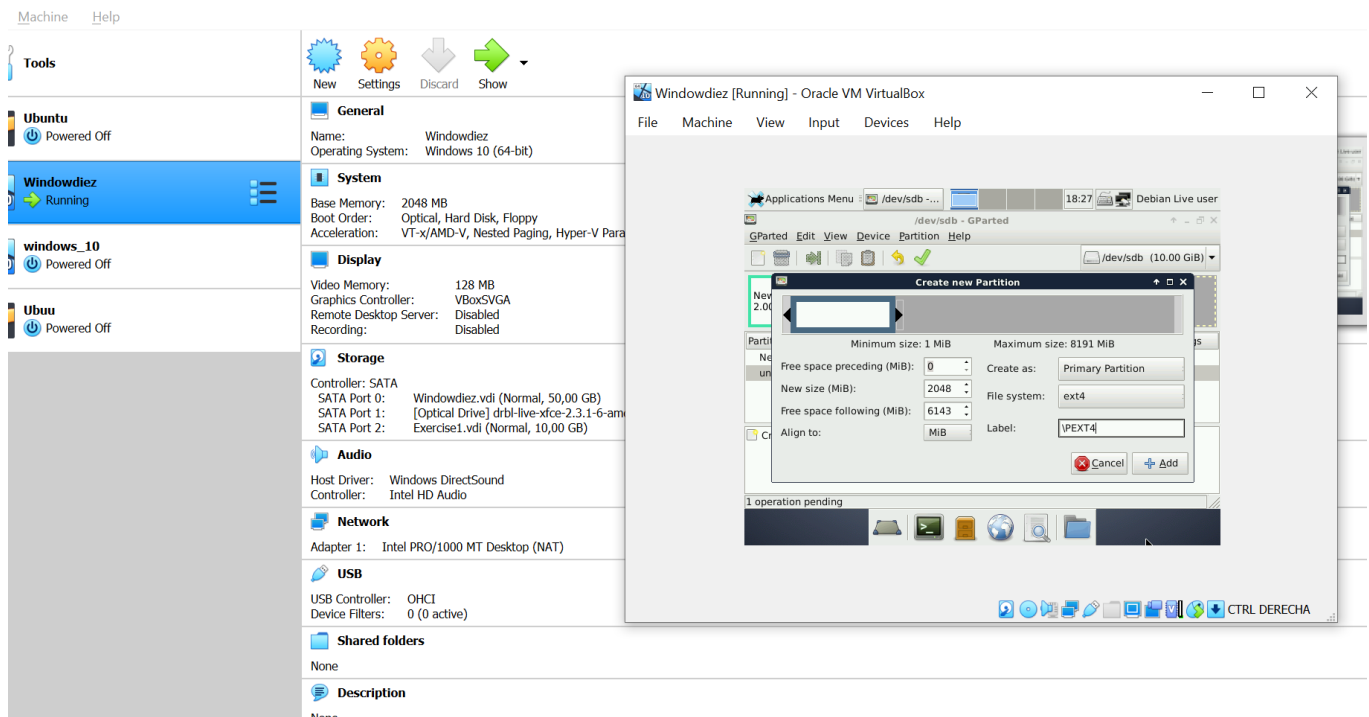

Then we select a New partition table and we click by default: MSDOS

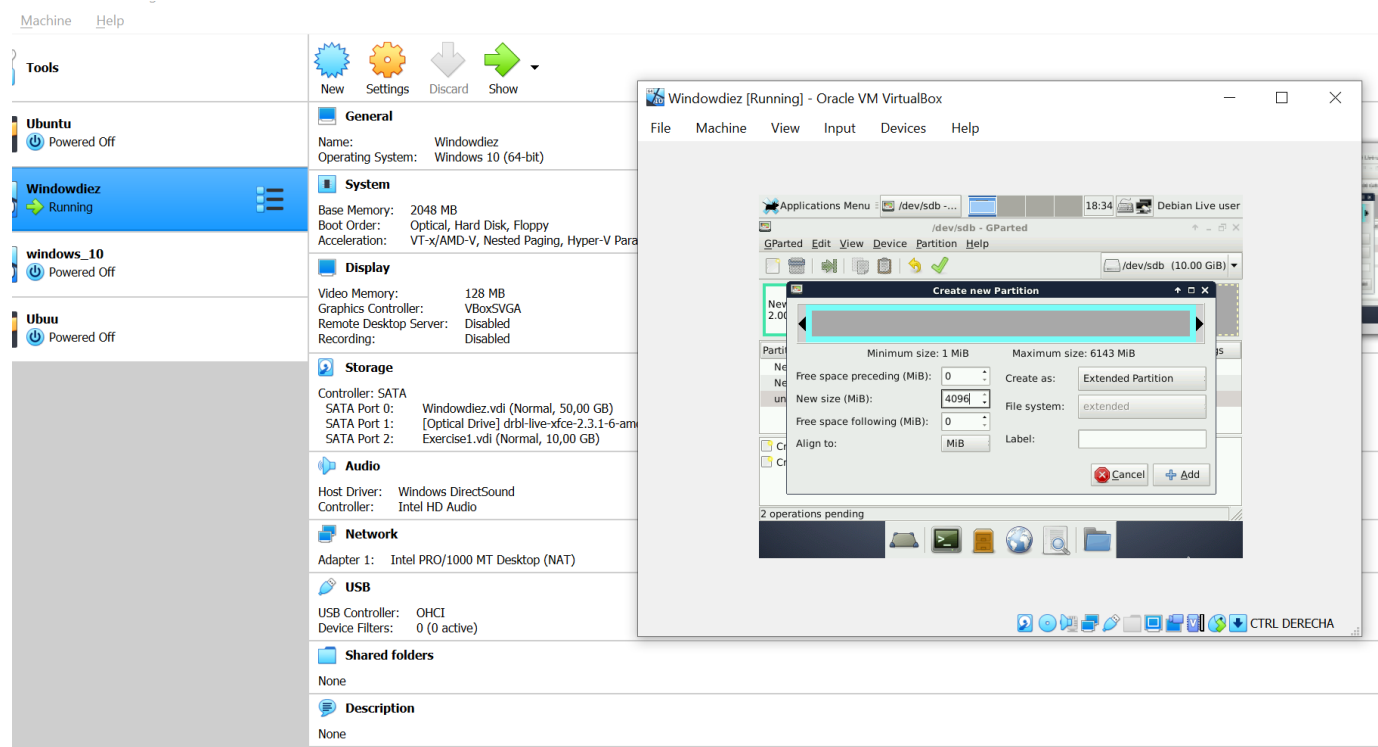

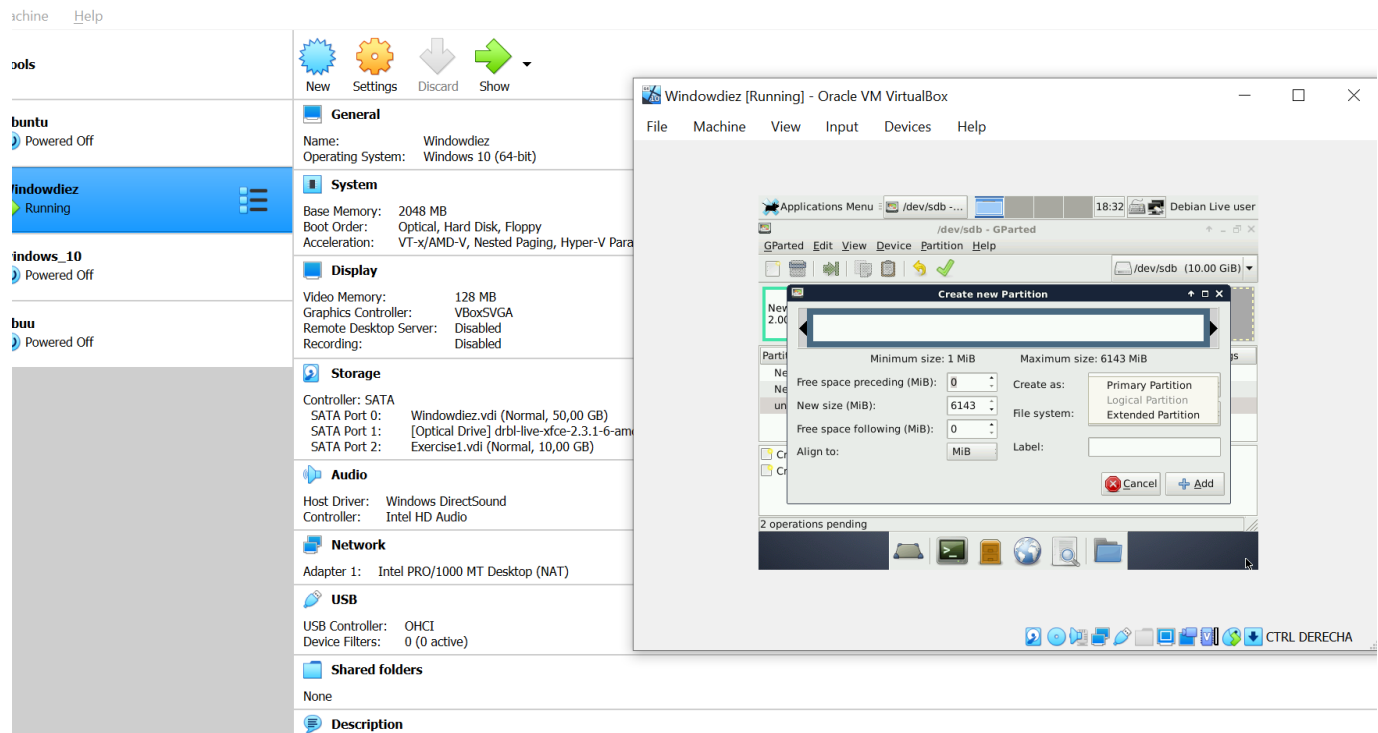

We select a New one and start to configure the first item: a NTFS primary partition of 2GB called PNTFS.

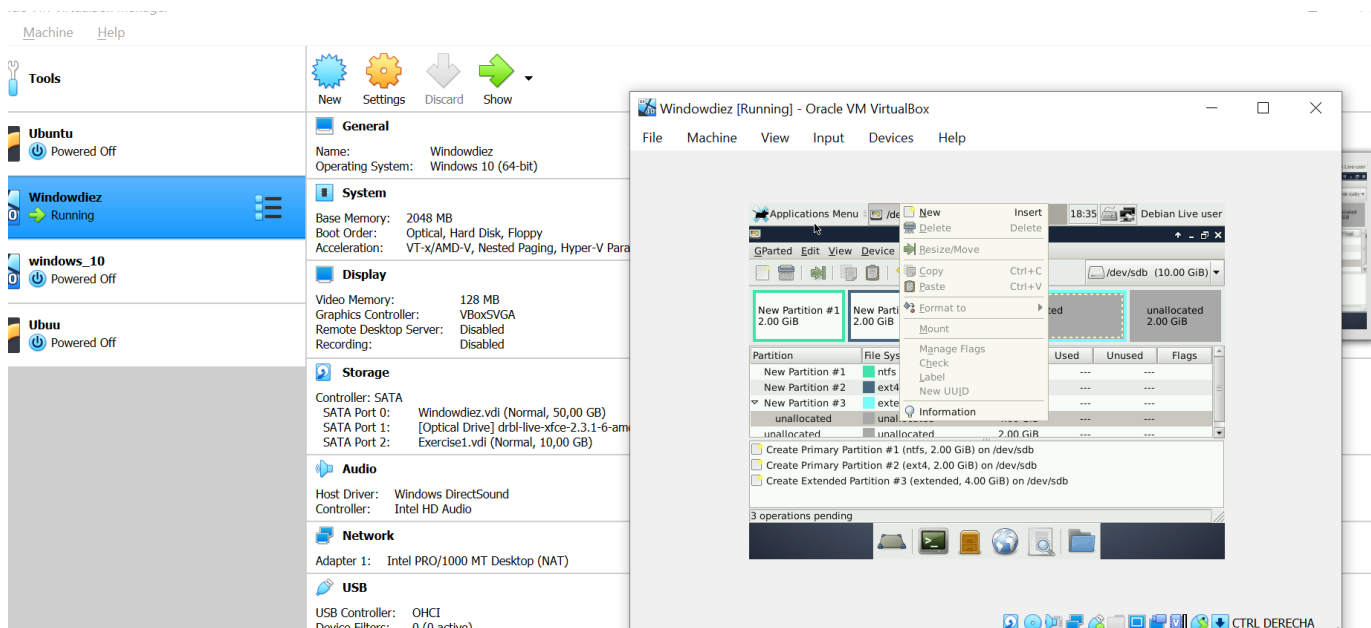

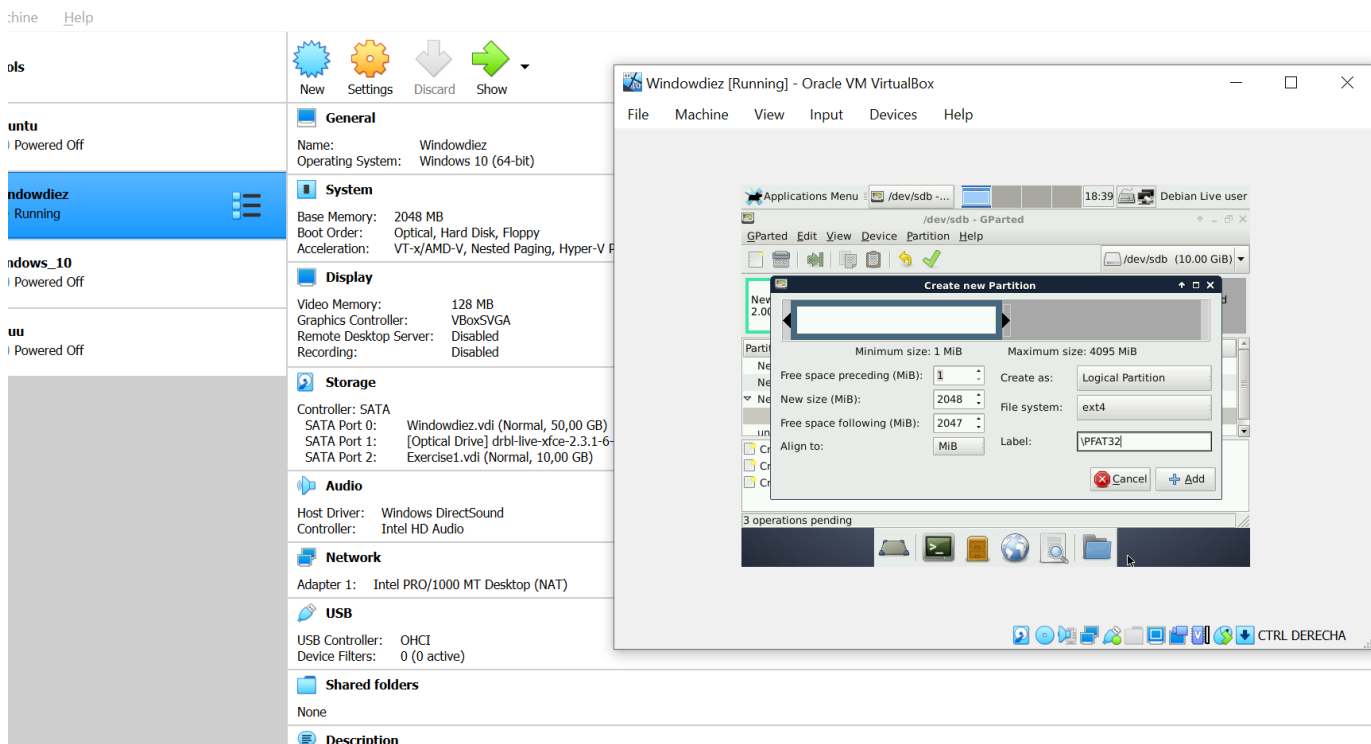

We continue with the third item: an extended partition of 4GB.

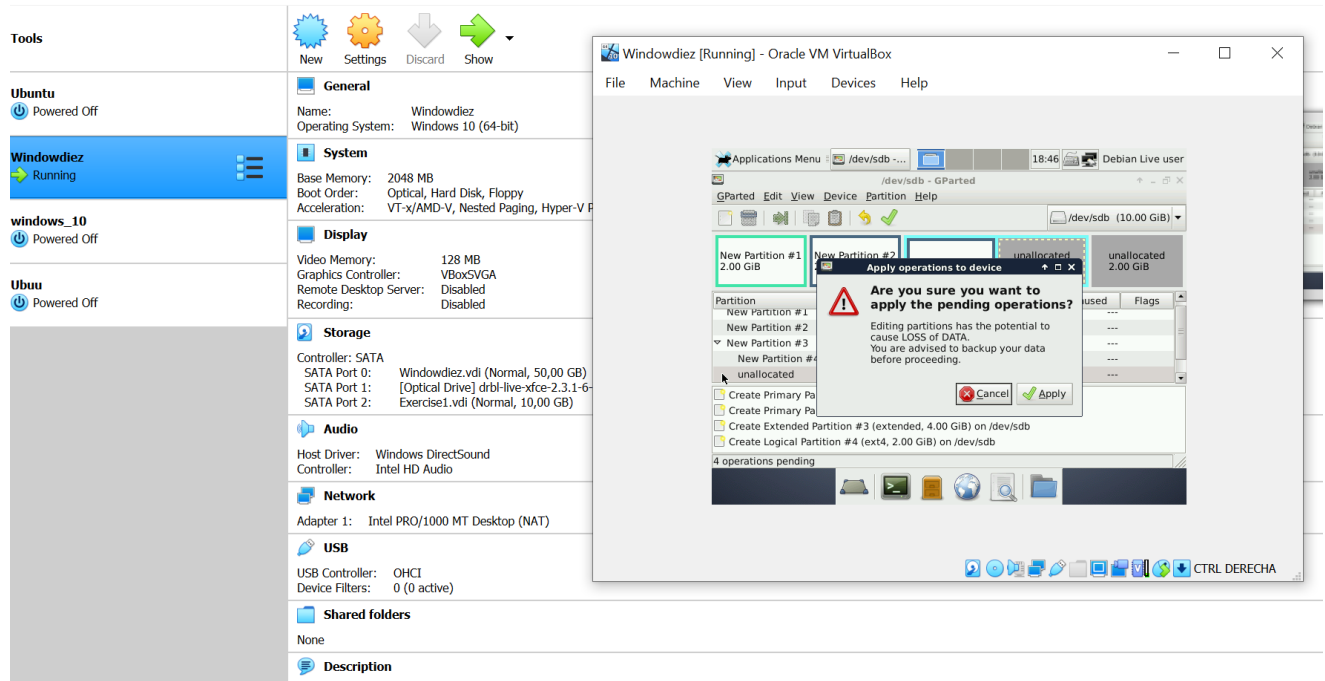

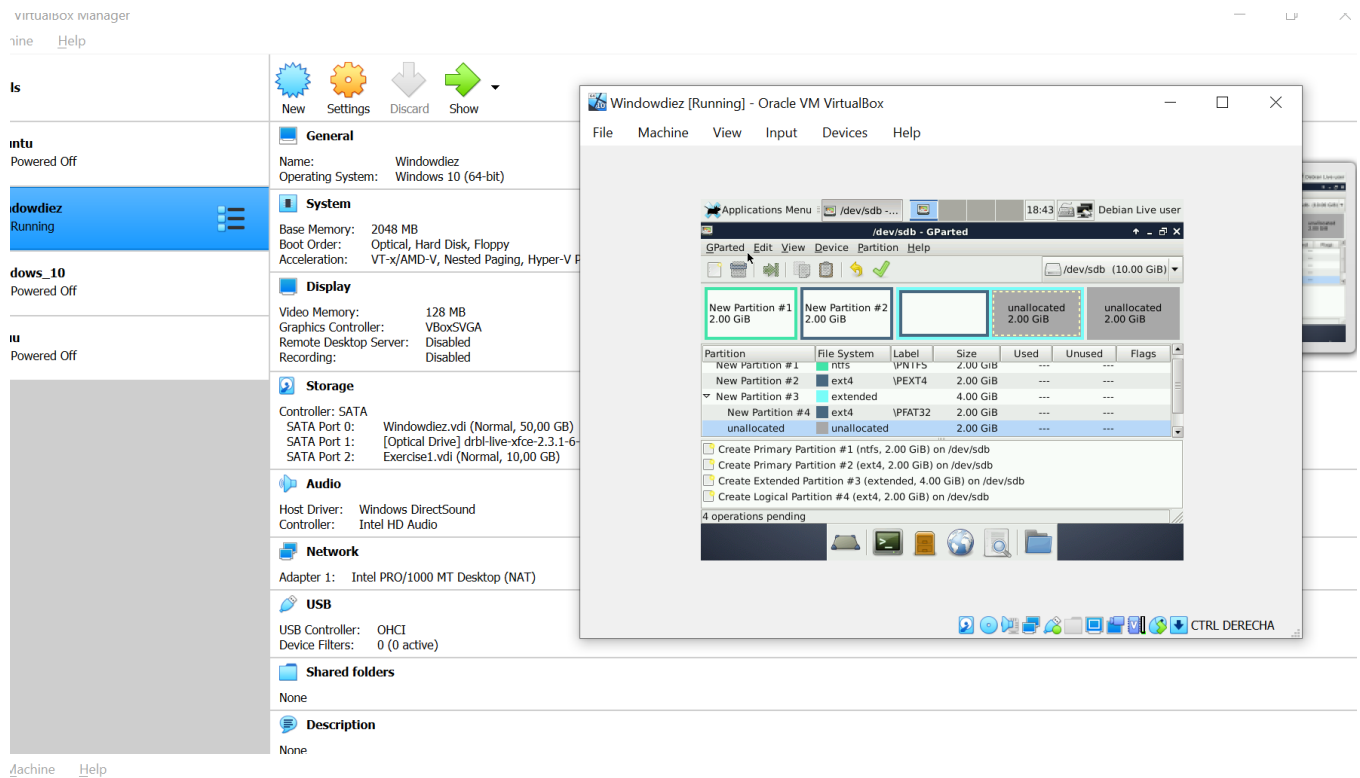

Now, for the last item, we select a new one partition inside the extended partition:

Then we select the last item: a logical partition of 2GB called PFAT32.

Now it's done but we need to confirm with the apply button:

Finally we check it on Windows manager disk to see how we did it.
